

Idea #2: onclick/onkeydown: Weather

1. Description

- Events that occur during onclick will be based on the current weather forecast.
 - If it's sunny, when the user presses their mouse button, an icon/image of a sun will appear on the screen in the place they clicked.
 - If it's cloudy: an icon of a cloud will appear; snowing: snowflake; raining: raindrop;
- The same icons will appear as they would on onclick with onkeydown, except the icons will appear on the page starting at the top lefthand corner and continue in a horizontal fashion, and appear in a second, third, fourth, etc. row from right to left if they are pressed enough times.
- The current temperature will be displayed in the same fashion as idea #1.
- In the top left-hand corner, the weather's location, temperature, wind speed, and forecast will display.

2. Sketches
